BILLING CODE 7555–01–M

NUCLEAR REGULATORY COMMISSION

[Docket No. 50–247]

Consolidated Edison Company of New York (Indian Point Nuclear Generating Unit No. 2); Exemption

I

Consolidated Edison Company of New York, Inc. (Con Edison or the licensee) is the holder of Facility Operating License No. DPR–26, which authorizes operation of Indian Point Nuclear Generating Unit No. 2 (the facility or IP2), at a steady-state reactor power level not in excess of 3071.4 megawatts thermal. The facility is a pressurized water reactor located at the licensee's site in Westchester County, New York. The license provides among other things, that it is subject to all rules, regulations, and Orders of the U.S. Nuclear Regulatory Commission (the Commission or NRC) now or hereafter in effect.

II

Section III.D.1.(a) of Appendix J to 10 CFR Part 50 requires the performance of three Type A containment integrated leakage rate tests (ILRTs), at approximately equal intervals during each 10-year service period of the primary containment. The third test of each set shall be conducted when the plant is shutdown for the 10-year inservice inspection of the primary containment.

III

By letters dated September 19, 1994, January 13, 1995, and February 3, 1995, Con Edison requested temporary relief from the requirement to perform a set of three Type A tests at approximately equal intervals during each 10-year service period of the primary containment. The requested exemption would permit a one-time interval extension of the third Type A test by approximately 24 months (from the 1995 refueling outage, currently scheduled to begin in February 1995, to the 1997 refueling outage) and would permit the third Type A test of the second 10-year inservice inspection period to not correspond with the end of the current American Society of Mechanical Engineers Boiler and Pressure Vessel Code (ASME Code) inservice inspection interval.

The licensee's request cites the special circumstances of 10 CFR 50.12, paragraph (a)(2)(ii), as the basis for the exemption. They point out that the existing Type B and C testing programs are not being modified by this request and will continue to effectively detect containment leakage caused by the degradation of active containment isolation components as well as containment penetrations. It has been the consistent and uniform experience at IP2 during the five Type A tests conducted from 1976 to date, that any significant containment leakage paths are detected by the Type B and C testing. The Type A test results have only been confirmatory of the results of the Type B and C test results. Additionally, the Indian Point 2 Containment Penetration and Weld Channel Pressurization System provides a means for continuously pressurizing the positive pressure zones incorporated into the containment penetrations, the channels over the welds in the steel inner liner and certain containment isolation valves. This system provides continuous monitoring of these potential containment leakage paths, thus providing further assistance during power operation that a leak path does not exist and further obviates the need
